Project Information

1) Project Duration : (60 Days)

- a) Date of Summer Internship commencement (06/08/2026)
- a) Date of Summer Internship Completion (15/10/2026)

2) Topic

CampusEats:Smart Food Ordering and Meal Management System

3) Project Objective

Project ObjectiveThe main objective of CampusEats is to develop a web-based campus food ordering system that makes food ordering more convenient, organized, and efficient for students. The system allows students to browse the available menu, search and filter food items, add items to their wishlist or cart, place orders, and track their order history. It also uses Firebase Authentication and Firestore to securely manage user accounts and order-related data. Another objective is to provide AI-assisted food recommendations based on user preferences and activity. In addition, CampusEats aims to support meal management and food-waste reduction by using order data to understand food demand and help canteens make better preparation decisions. Overall, the project aims to reduce manual ordering processes, improve the student food-ordering experience, and support more efficient campus food management.

4) Methodology to be adopted

The Agile methodology will be adopted for the development of CampusEats. The project will be developed in small and manageable stages, allowing features to be tested and improved throughout the development process. 1. Requirement Analysis – Identify the needs of students and campus food-service operations, including food ordering, menu browsing, order tracking, recommendations, and meal management. 2. System Design – Design the website structure, user interface, database structure, and overall system workflow. 3. Development – Implement the system using HTML, CSS, JavaScript, Firebase Authentication,

and Firestore. 4. Feature Integration – Integrate food search and filtering, cart, wishlist, orders, AI-assisted recommendations, and meal/waste management features. 5. Testing – Test individual features and the complete system in a web browser to identify and fix errors. 6. Evaluation and Improvement – Analyze the system’s functionality and improve the interface and features based on testing results. This iterative approach helps develop CampusEats in a structured manner while allowing changes and improvements during development.

5) Brief Summery of project(*to be duly certified by the industry guide*)

CampusEats is a web-based campus food ordering and management system designed to make food ordering easier and more organized for students. The system allows students to browse the campus food menu, search and filter food items, add items to their cart or wishlist, place orders, and view their order history. Firebase Authentication is used for user authentication, while Firebase Firestore manages user and order-related data. The project also includes AI-assisted food recommendations that provide personalized food suggestions based on user preferences and activity. In addition, the system introduces meal management to support better understanding of food demand, preparation, and wastage. By using digital order data, CampusEats can help campus food services make better preparation decisions and reduce unnecessary food waste. Overall, the project aims to provide a convenient ordering experience while supporting more efficient and sustainable campus food management.
